

ASSIGNMENT 01 - PART A: REQUIREMENT SPECIFICATION

Web-Based Bookstore System | Group ID: MLB-B12G2-06

Assignment Mode: Group

Deliverable: Requirement Specification

Scope: Entire Web-Based Bookstore System

1. System Purpose

The Web-Based Bookstore System provides a centralized online platform for customers to discover and purchase books while enabling bookstore staff to manage catalogue data, stock, orders, customer support, payments, and business reporting. The system is intended to make book discovery and purchasing convenient, keep operational and financial records consistent, support fulfilment and customer communication, and provide management information for decision-making.

2. Users

User	Primary system responsibilities
Customer	Searches/browses books, manages cart and wishlist, checks out, pays, tracks orders, and contacts support.
Owner	Reviews sales/revenue performance, trends, catalogue/inventory performance, and key business indicators.
Store Operations Manager	Coordinates order fulfilment, delivery stages, store-to-store fulfilment, and operational exceptions.
Customer Service Supervisor	Manages support tickets, responses, FAQ/support information, and customer notifications.
Inventory and Purchasing Officer	Maintains books/categories/authors, stock levels, low-stock actions, suppliers, and purchasing information.
Finance and Accounts Manager	Monitors payment transactions and manages invoices, refunds, financial controls, and reports.

3. Functional Requirements

ID	Major Function	Requirement
FR-01	Book Browsing & Search	Customers shall search books by title, author, ISBN, keyword, or category/genre.
FR-02	Book Browsing & Search	Customers shall filter books by category, author, price, publisher, language, year, availability, and rating.
FR-03	Book Browsing & Search	The system shall sort results by price, newest, best-selling/highest-rated, or alphabetical order.
FR-04	Book Browsing & Search	Customers shall view book details including title, cover, author, price, description, and availability.
FR-05	Shopping Cart & Checkout	Customers shall add, view, update, remove, or clear cart items and move books between cart and wishlist.
FR-06	Shopping Cart & Checkout	The system shall validate stock/quantity, avoid duplicate cart lines, and recalculate subtotals and totals after changes.
FR-07	Shopping Cart & Checkout	Checkout shall confirm customer/delivery data, show items and charges, and calculate discount, tax, shipping, and final total.
FR-08	Shopping Cart & Checkout	The system shall record payment attempts/statuses, confirm successful payments/orders, retain failed/pending attempts, and prevent duplicate charges.

3. Functional Requirements (continued)

ID	Major Function	Requirement
FR-09	Order Management & Tracking	Authorized staff shall search/view orders by order/customer/date/status/delivery criteria, including tracking details.
FR-10	Order Management & Tracking	Only authorized operations staff shall update fulfillment/order status; customers shall have read-only status/tracking access.
FR-11	Order Management & Tracking	The system shall validate status transitions and preserve corrections with previous/new status, time, and responsible user.
FR-12	Order Management & Tracking	Customers shall view their own current/previous orders with ID/date, items, quantities, total, status, delivery/tracking, and cancellation data.
FR-13	Inventory & Catalog	The system shall maintain ISBN, title, author, category, publisher, price, description, cover image, and stock quantity for each book.
FR-14	Inventory & Catalog	Authorized inventory staff shall add/update catalogue records; duplicate identifiers shall be prevented and historical books may be marked inactive.
FR-15	Inventory & Catalog	The system shall maintain stock and change history for additions, sales, cancellations, returns, and adjustments, and mark out-of-stock books.
FR-16	Inventory & Catalog	The system shall issue low-stock alerts and support supplier/purchase-order information for replenishment.
FR-17	Customer Support & Notifications	Customers shall submit support requests with order number where relevant, issue category, and description.
FR-18	Customer Support & Notifications	Customers shall view support status/responses; authorized support staff shall manage, assign, and update tickets.
FR-19	Customer Support & Notifications	The system shall notify customers about order placement, payment confirmation, shipment, delivery, cancellation, and refund events.
FR-20	Customer Support & Notifications	Notifications shall use supported channels such as website/email; preferences may control non-essential alerts, and support staff shall be alerted to new requests/maintain FAQ information.
FR-21	Financial Reporting & Admin	The Owner shall view sales/revenue dashboards and key business performance indicators.
FR-22	Financial Reporting & Admin	The Owner shall review customer, order, sales, catalogue, and inventory trends/performance.
FR-23	Financial Reporting & Admin	The Finance and Accounts Manager shall manage invoices/refunds and maintain traceable financial records for reconciliation.
FR-24	Financial Reporting & Admin	The system shall generate sales, revenue, and refund reports and provide management/administrative reporting views.

Traceability: FR-01 to FR-24 consolidate the six approved major functions and the uploaded chatbot requirement evidence into one group specification.

4. Non-Functional Requirements

ID	Quality Area	Requirement
NFR-01	Security & Privacy	Role-based access shall restrict staff actions, and customers shall access only their own personal/order/support information.
NFR-02	Performance & Usability	Searching, browsing, filtering, sorting, and common user actions shall be responsive and easy to use.
NFR-03	Data Integrity	Identifiers, stock, cart totals, payment states, and order-status transitions shall remain valid and consistent.
NFR-04	Reliability & Concurrency	The system shall revalidate stock during checkout, prevent overselling, and prevent duplicate successful payment charges.
NFR-05	Auditability	Inventory changes, order-status corrections, and payment history shall be traceable rather than silently overwritten.
NFR-06	Scalability & Maintainability	The system shall support growth in catalogue size, customers, orders, and operational records without changing the core business model.

5. Constraints / Assumptions

ID	Constraint / Assumption
C-01	The six major functions form one integrated web-based bookstore and share common catalogue, customer, order, inventory, and financial data.
C-02	Only authorized roles may modify catalogue, stock, fulfilment, support, payment, and administrative records within their responsibilities.
C-03	Customers may view/manage only their own cart, wishlist, order history, and support requests; operational statuses are system/staff controlled.
C-04	Checkout cannot confirm quantities above current stock; availability must be rechecked before order confirmation.
C-05	Book identifiers must be unique, and historical order references must be preserved; previously sold books may be made inactive instead of hard-deleted.
C-06	Financial/management reporting depends on accurate operational data; website/email are supported notification channels and pricing rules must be applied consistently at checkout.

6. Requirement-Gathering Method

Each group member used an AI chatbot as a simulated stakeholder/requirements source for the member's assigned major function. The questions focused on expected user actions, business rules, data needs, permissions, error/exception handling, and quality constraints. The resulting answers were reviewed together and reconciled with the approved Agile report so the final specification represents one coherent Web-Based Bookstore System rather than six separate documents.

Evidence Index

Member	Student ID	Major Function	Evidence
Dayawansa A. T. M. S.	IT25103091	Book Browsing & Search	A1-A4
Ariyaratna K. M. N. N.	IT25102471	Shopping Cart & Checkout with Payment	A5-A9

Appendix A - Evidence of Requirement Gathering | Figure A1

Dayawansa A. T. M. S. (IT25103091) - Book Browsing & Search

Browsing/search functionality and catalogue discovery requirements

We are developing a web-based bookstore system. My assigned major function is Book Browsing and Search. What functionality should a customer have when browsing and searching for books?

As a customer using a web-based bookstore, I would expect the Book Browsing and Search function to have these features:

1. 🔍 **Search for books**
 - Search by book title, author, ISBN, or keyword.
 - The search should be fast and easy to use.
 - It would be helpful if suggestions appear while typing.
2. 📖 **Browse books by category**
 - Browse categories such as Fiction, Education, IT, Business, Romance, etc.
 - I should be able to select a category and see the available books.

3. Filter books

- Filter by:
 - Category
 - Author
 - Price range
 - Publisher
 - Language
 - Availability
 - Rating

4. Sort books

- Sort by:
 - Price: Low → High
 - Price: High → Low
 - Newest books
 - Best-selling books
 - Highest-rated books
 - Alphabetical order

5. View book details

- When I select a book, I should see:
 - Book title
 - Cover image
 - Author
 - Price

Appendix A - Evidence of Requirement Gathering | Figure A3

Dayawansa A. T. M. S. (IT25103091) - Book Browsing & Search

Search criteria: title, author, ISBN, category, publisher, keyword, price, language, year, availability, rating

What search criteria should customers be able to use to find books?

As a customer, I would like to search for books using several criteria, because sometimes I know the title, but sometimes I only know the author or ISBN.

I would expect these search criteria:

- **Book title** – search by the full or partial title.
- **Author name** – find books written by a particular author.
- **ISBN** – search for a specific book using its ISBN.
- **Category/genre** – for example, Fiction, IT, Business, Education, Romance, etc.
- **Publisher** – find books from a particular publisher.
- **Keyword** – search using words from the title or book description.
- **Price range** – find books within a specific budget.
- **Language** – search for books in a particular language.
- **Publication year/date** – find newer or older books.
- **Availability** – show only books that are currently in stock.
- **Rating** – find highly rated books.

Appendix A - Evidence of Requirement Gathering | Figure A4

Dayawansa A. T. M. S. (IT25103091) - Book Browsing & Search

Browsing filters and combined-filter behavior

What filters should be available when browsing books?

As a customer, I would like to have filters that help me quickly narrow down the books I am interested in.

I would expect these filters:

-  **Category / Genre** – Fiction, Education, IT, Business, Romance, etc.
-  **Author** – select one or more authors.
-  **Price Range** – set a minimum and maximum price.
-  **Publisher** – filter by publisher.
-  **Language** – English, Sinhala, Tamil, etc.
-  **Publication Date/Year** – find recently published or older books.
-  **Customer Rating** – for example, 4 stars and above.
-  **Availability** – In Stock / Out of Stock.
-  **Book Format** – Hardcover, Paperback, eBook, etc., if the store provides different formats.

I would also like to **combine multiple filters**. For example, I might select IT → English → Under Rs. 5,000 → 4+ stars → In Stock.

There should also be a **Clear/Reset Filters** option so  easily remove all selected filters.

Appendix A - Evidence of Requirement Gathering | Figure A5

Ariyaratna K. M. N. N. (IT25102471) - Shopping Cart & Checkout with Payment

Module purpose, end-to-end checkout flow, and shopping-cart operations

Nadun

For a Web-Based Bookstore System, what should the Shopping Cart & Checkout with Payment module do?

Share

For a Web-Based Bookstore System, the Shopping Cart & Checkout with Payment module should manage everything from the moment a customer adds a book to the cart until the order and payment are successfully recorded.

Main purpose

The module should allow customers to select books, manage their shopping cart, review the purchase, complete checkout, choose a payment method, and place the order.

A suitable overall flow is:

Browse Books → Add to Cart → Manage Cart → Checkout → Enter Delivery Details → Choose Payment Method → Confirm Order → Process/Record Payment → Generate Order Confirmation

1. Shopping Cart Management

The customer should be able to:

- Add a book to the cart.
- View all books currently in the cart.
- Change the quantity of a book.
- Remove a book from the cart.
- Clear the entire cart.
- See the price of each book.
- See the subtotal for each item.
- See the total number of items.
- See the overall cart total.
- Check whether the requested quantity is available in stock.

Example:

Book	Price	Quantity	Subtotal
+ Ask ChatGPT			High

Appendix A - Evidence of Requirement Gathering | Figure A6

Ariyaratna K. M. N. N. (IT25102471) - Shopping Cart & Checkout with Payment

Shopping cart and wishlist actions

Nadun

What actions should a customer be able to perform on a shopping cart and wishlist?

Share

For a Web-Based Bookstore System, the customer should be able to perform these actions:

Shopping Cart

The customer should be able to:

- Add a book to the cart
- View all books in the cart
- Update the quantity of a book
- Remove a book from the cart
- Clear the entire cart
- View book price and subtotal
- View the total cart amount
- Check stock availability
- Move a book from the cart to the wishlist
- Proceed to checkout

Example flow:

Browse Book → Add to Cart → Change Quantity → Review Total → Checkout

Wishlist

The customer should be able to:

- Add a book to the wishlist
- View all wishlist books
- Remove a book from the wishlist
- Move a wishlist book to the shopping cart
- View book details from the wishlist
- See current price and availability
- Optionally, clear the entire wishlist

Business rules for adding/updating/removing books in the cart

Nadun

What business rules should apply when adding, updating or removing books from a cart?

Share

For a **Web-Based Bookstore System**, these are good business rules for managing books in the shopping cart.

1. Rules when adding a book to the cart

- The book must **exist in the system** and be available for sale.
- The book must have **available stock** before it can be added.
- The requested quantity cannot exceed the available stock.
- The quantity must be at least 1.
- If the same book is already in the cart, the system should **increase its quantity instead of creating a duplicate cart item**.
- After increasing the quantity, the total quantity must still not exceed available stock.
- The system should use the book's **current selling price** when calculating the cart total.
- Inactive, unavailable, or discontinued books should not be added.
- The system should immediately recalculate the **item subtotal and cart total**.

Example:

Available stock = 5
Customer already has 2 copies in the cart.
Customer adds another 2.
New quantity = 4 → Allowed
Customer tries to add another 2 → Not allowed because total would become 6.

2. Rules when updating quantity

- The new quantity must be a valid whole number.
- The quantity cannot be negative.
- The updated quantity cannot exceed the current available stock.
- If the customer enters 0, the system can treat this as removing the book from the cart.

+ Ask ChatGPT

High

Appendix A - Evidence of Requirement Gathering | Figure A8

Ariyarathna K. M. N. N. (IT25102471) - Shopping Cart & Checkout with Payment

Information required during checkout

Nadun

What information is required during checkout?

Share

For a Web-Based Bookstore System, checkout should collect only the information needed to complete the order, delivery, and payment.

Information required during checkout

Section	Required Information
 Customer Details	Full name, phone number, email address
 Delivery Details	Delivery address, city/town, postal code if required
 Delivery Method	Standard delivery, express delivery, store pickup if supported
 Order Details	Books, quantities, unit prices, subtotals
 Order Total	Subtotal, discounts, delivery charge, final payable amount
 Payment Method	Cash on Delivery, bank transfer, or supported online payment method
 Payment Details	Transaction/reference number and payment receipt for bank transfer, if applicable
 Confirmation	Customer reviews and confirms the order before submission

1. Customer information

If the customer is already logged in, these details can be automatically taken from their account:

- First name and last name
- Email
- Mobile number

↓

The customer should be able to confirm or update necessary checkout details.

Handling successful, failed, and pending payments

Nadun

How should successful, failed and pending payments be handled?

Share

For a Web-Based Bookstore System, payment handling should depend on the payment status: **Successful**, **Failed**, or **Pending**.

✓ **1. Successful Payment**

When payment is successful, the system should:

- Change payment status to **Paid / Successful**.
- Confirm the customer's order.
- Change order status to something like **Confirmed** or **Processing**.
- Store the payment transaction/reference number.
- Record the payment date and amount.
- Reduce or confirm the reserved stock quantity.
- Generate an order confirmation or receipt.
- Show a success message to the customer.
- Send confirmation by email or notification if supported.

Example:

Payment Status: **Paid**

Order Status: **Confirmed**

Order ID: ORD-1052

Total Paid: Rs. 8,500

A good flow is:

Payment Submitted → Payment Verified → Paid → Order Confirmed → Receipt Generated

✗ **2. Failed Payment**

↓

If the payment fails, the system should:

+ Ask ChatGPT

High

🔊

• Inform the customer that the payment was unsuccessful.

Appendix A - Evidence of Requirement Gathering | Figure A10

Amasha M. A. N. (IT25100328) - Order Management & Tracking

Information to retain in customer order history

 Convert chat to PDF

What information should be included in a customer's order history?

A customer's **Order History** should provide a clear summary of all their previous and current orders. It should include:

1. **Order ID** – A unique identifier for each order.
2. **Order Date & Time** – When the order was placed.
3. **Ordered Books** – Names/titles of the books purchased.
4. **Quantity** – Number of copies ordered for each book.
5. **Total Order Amount** – The total cost of the order.
6. **Order Status** – For example, Confirmed, Processing, Shipped, Delivered, or Cancelled.
7. **Delivery Information** – Relevant delivery details or address.
8. **Tracking Number** – If the order has been shipped and tracking is available.
9. **Delivery Status** – Current delivery progress.
10. **Cancellation Information** – If the order was cancelled, including the cancellation status/date where applicable.

Example:

Order ID: ORD-10025

Date: 25 August 2026

Books: Introduction to Java × 1, Database Systems × 2

Total: Rs. 5,500

Status: Shipped

Tracking: Available

Appendix A - Evidence of Requirement Gathering | Figure A11

Amasha M. A. N. (IT25100328) - Order Management & Tracking

Customer access to previous and current order history

Should customers be able to view their previous orders and order history?

Yes. Customers should be able to **view their previous and current orders** through an **Order History** section.

The Order History should allow customers to:

1. View a list of their previous and current orders.
2. See the **Order ID, date, items, quantity, and total amount** for each order.
3. View the **current order status**.
4. View **delivery and tracking information** when available.
5. Select an order to view its complete details.
6. View cancelled and delivered orders for reference.
7. Access **only their own order history** to protect customer privacy.

This allows customers to easily monitor both **current orders** and their **previous purchases**.

Appendix A - Evidence of Requirement Gathering | Figure A12

Amasha M. A. N. (IT25100328) - Order Management & Tracking

Validation/correction of incorrectly updated order statuses

What should happen if an order status is updated incorrectly?

If an order status is updated incorrectly, the system should **prevent or correct the invalid status change without losing the order history**.

The system should:

1. **Validate status changes** before updating the order.
2. **Prevent invalid status transitions** (e.g., changing directly from *Delivered* back to *Processing*).
3. Allow only **authorized staff** to correct an incorrect status.
4. **Record the correction** with the previous status, new status, date/time, and responsible user.
5. Update the customer's view with the **correct current status**.
6. Send a notification to the customer if the correction significantly affects the order or delivery information.

Requirement example:

"The system shall validate order status updates and allow authorized users to correct incorrect statuses while maintaining an audit record of the original and corrected status."

Appendix A - Evidence of Requirement Gathering | Figure A13

Amasha M. A. N. (IT25100328) - Order Management & Tracking

Authorization rules for updating order status

Who should be allowed to update an order status?

The **Order Management & Tracking** module should allow only **authorized staff members** to update an order status.

- **Store Operations Manager** – Can update and manage order statuses throughout the fulfilment process.
- **Authorized Order/Operations Staff** – Can update statuses according to their assigned responsibilities and permissions.
- **Customer Service Supervisor** – Can view order status and, where permitted, make approved corrections.
- **Customers** – **Cannot directly change** their order status; they can only view the current status and tracking information.

The system should also use **role-based access control** so that each staff member can perform only the actions allowed by their role.

Requirement example:

“The system shall allow only authorized staff to update order statuses according to their assigned roles and permissions, while customers shall have read-only access to their order status.”

Appendix A - Evidence of Requirement Gathering | Figure A14

Amasha M. A. N. (IT25100328) - Order Management & Tracking

Order search, order details, tracking, and staff visibility requirements

Example:

Order ID: ORD-10025
Customer: John Silva
Order Date: 25 August 2026
Books: Introduction to Java × 1, Database Systems × 2
Total: Rs. 5,500
Status: Shipped
Tracking: TRK-45821
Delivery: In Transit

This allows authorized staff to quickly find an order and view all the information required to **process, track, and update the customer's order.**

Requirement example:

"The system shall allow authorized staff to search and view customer orders using Order ID, customer details, date, order status, and delivery status, including order details and tracking information."

Appendix A - Evidence of Requirement Gathering | Figure A15

Book information and authorized catalogue maintenance

✦ Turn on Plu

1. Question:

What information should be stored for each book?

Answer:

The system should store the ISBN, title, author, category, publisher, price, description, cover image, and available stock quantity.

2. Question:

Who should be allowed to add new books to the catalogue?

Answer:

Only authorized users, such as the Inventory and Purchasing Officer, should be allowed to add new books.

3. Question:

Should staff be able to update book information?

Answer:

Yes. Authorized staff should be able to update book details such as the title, author, category, price, description, and stock quantity.

Appendix A - Evidence of Requirement Gathering | Figure A16

Dewmina T. G. R. S. (IT25102169) - Inventory & Catalog Management

Inventory history and duplicate-book prevention

7. Question:

◆ Turn on P

Should the system keep a record of inventory changes?

Answer:

Yes. The system should maintain a history of stock changes, including stock additions, sales, cancellations, returns, and manual adjustments.

8. Question:

How should duplicate book records be prevented?

Answer:

The system should check the ISBN or another unique identifier before adding a new book and warn staff if the book already exists.

Appendix A - Evidence of Requirement Gathering | Figure A17

Dewmina T. G. R. S. (IT25102169) - Inventory & Catalog Management

Stock updates, out-of-stock handling, and low-stock notification

4. Question:

✦ Turn on Plus

How should the system manage book stock?

Answer:

The system should maintain the available quantity of each book and update the stock when books are added, sold, cancelled, or adjusted.

5. Question:

What should happen when a book is out of stock?

Answer:

The system should mark the book as out of stock and prevent customers from purchasing a quantity that is not available.

6. Question:

Should the system notify staff when stock is low?

Answer:

Yes. The system should notify the Inventory and Purchasing Officer when the stock quantity reaches or falls below the predefined reorder level.

9. Question:

Should the system allow books to be removed from the catalogue?

Answer:

Authorized staff should be able to mark a book as inactive instead of permanently deleting it, especially if the book has previous order records.

10. Question:

What happens if multiple customers try to purchase the last copy of a book?

Answer:

The system should validate stock availability during checkout and prevent overselling when multiple customers attempt to purchase the same limited stock.

Appendix A - Evidence of Requirement Gathering | Figure A19

Wittahachchi S. D. (IT24102366) - Customer Support & Notifications

Notification channels/preferences and support-team alerts

2:37 PM Fri Aug 28

What notifications should customers receive after placing an order?

86%

Answer:

Customers should receive notifications when an order is successfully placed, payment is confirmed, the order is shipped, and the order is delivered. Notifications should include order ID, item name, quantity, price, and estimated delivery date.

Requirement:

The system shall notify customers about important changes in their order status.

Share Message

Yes. Since your assigned major function is Customer Su...

4. Notification Methods

Question:

How should the system send notifications to customers?

Answer:

The system should provide notifications through the website and email. Customers should receive important notifications automatically, while non-essential notifications can be controlled through their notification preferences.

Requirement:

The system shall send relevant customer notifications through supported communication channels and allow customers to manage notification preferences where applicable.

5. Support Team Notifications

Question:

Should the customer support team be notified when a new support request is submitted?

Answer:

Yes. When a customer submits a new support request, the system should notify the customer support team. The notification should contain the request ID, customer information, issue category, and submission time so that the team can respond efficiently.

Requirement:

The system shall notify authorized customer support staff when a new support request is submitted.

🌟 Best 5 for your assignment

These five cover the important areas:

Customer → Submit Support Request → Track Request → Receive Order Notifications → Manage Notifications → Support Staff Notification

They are also easy to turn into FRs in the final group requirement document and provide good evidence for the chatbot requirement-gathering section.

System stakeholders/users identified during chatbot interview

 Copilot

Nuwan Perera – Store Manager

Good question.

The main stakeholders/users of our Web-Based Book Store System are:

1. **Customers**

They register, search books, view details, manage carts and wishlists, place orders, submit reviews, and check order history. 

2. **Bookstore Staff**

They manage customer inquiries, reviews, and order-related activities. 

3. **Inventory Officers**

They add books, update stock, manage categories, authors, and inventory records. 

4. **Order/Accounts Staff**

They monitor orders, invoices, payment information, and order status. 

5. **System Administrator**

They maintain the system, manage user access, and ensure smooth operation of the bookstore platform.

Appendix A - Evidence of Requirement Gathering | Figure A23

Gamage T. P. M. (IT25101328) - Financial Reporting & Admin Dashboard

Primary/secondary stakeholder classification and follow-up on needs/goals/permissions

For your requirement document, I would classify them as:

Primary Users: Customers, Inventory Officers, Order Staff

Secondary Stakeholders: Store Manager, Customer Service Staff, System Administrator. 

You can ask me next about stakeholder needs, goals, or permissions of each user type.

   ...  Sources

Okay next tell me about stakeholder needs, goals and permissions of each user

 Copilot

Dilani Fernando – Customer Service Supervisor

That's an important requirement question. Here are the stakeholder needs, goals, and permissions we expect for each user type in the Web-Based Book Store System. 

Appendix A - Evidence of Requirement Gathering | Figure A24

Gamage T. P. M. (IT25101328) - Financial Reporting & Admin Dashboard

Customer needs, goals, and permissions captured in the stakeholder interview

1. Customer

Needs

- Easy registration and login
- Search and browse books quickly
- Manage cart and wishlist
- Place orders and track them
- Submit reviews and inquiries

Goals

- Find the required books easily
- Buy books with minimum effort
- Keep track of previous purchases

Permissions

- Create and manage own account
- View books and categories
- Add/remove items from cart and wishlist
- Place and cancel own orders
- Submit reviews, feedback, and inquiries
- View own order history only
